Hiring Team

VOLTO Consulting

ChatGPT enablement works when demonstrations become reliable operating practice. The role brings together the right disciplines: workflow optimization, ongoing demonstrations, adoption analytics, prompt governance, and functional playbooks.

I bring the combination required to make that system practical. Through DudeWorth, I design AI-readiness and agentic workflow patterns around structured context, retrieval, human judgment, escalation, evaluation, and governance. At Vape-Jet, I work directly across production, support, quality, customer success, ERP, Jira, HubSpot, Slack, telemetry, and AI-assisted workflows - connecting signals to prioritized work, standard work, training, and accountability. Earlier, I built operating mechanisms in Amazon's 24/7 customer-backward environment supporting approximately five million second-day orders annually.

My candidate vision for this role is a **Capability Transformer**: new ChatGPT functionality enters as potential, then passes through workflow fit, data and authority controls, repeatability, adoption, and measurement before it earns scale. The objective is a shorter path from a feature release to a governed workflow that produces better work.

I would begin by baselining how teams use ChatGPT today, identifying three high-value workflows, mapping their data boundaries and decision owners, and pairing pilots with evaluation criteria and adoption instrumentation. Demonstrations would be attached to practice, office hours, and a champion network. Successful patterns would become owned playbooks, supported by clear ownership, review cadence, and continuous improvement.

WHAT I WOULD DELIVER FIRST

A baseline of current usage and workflow friction; three bounded pilots with evaluation and governance criteria; and a repeatable demo-to-adoption cadence that turns successful patterns into owned playbooks.

I prepared an independent candidate vision and working artifacts for this application. The role-specific candidate vision is available at <https://russelldudek.github.io/Volto/>; it includes the Capability Transformer, role operating brief, entry plan, and Power User Enablement Kit. I would welcome a conversation about how VOLTO wants this role to connect internal enablement, client delivery, governance, and measurable workflow value.

Carpe diem,

Russell Dudek
