

Turn new AI capability into work that sticks.

Role operating brief for the ChatGPT Power User Enablement Analyst opportunity by Russell Dudek.

ACTUAL WORK

Convert fragmented ChatGPT experimentation and rapid product change into a governed portfolio of repeatable workflows that employees adopt and leaders can measure.

Company moment

VOLTO publicly positions itself at the intersection of technology, talent, strategy, corporate training, AI and automation, and advisory-to-delivery outcomes. This role can make that promise tangible in daily knowledge work.

Candidate thesis

Optimize the conversion rate from capability to governed work: fit, safe use, repeatability, adoption, and measurable outcome.

Operating tensions

Feature velocity vs. stable practice; experimentation vs. data boundaries; usage volume vs. business value; shared standards vs. functional fit; demonstrations vs. durable behavior.

Capability Transformer

Inputs: new capabilities, workflow friction, data boundaries.

Conversion: fit, safety, human authority, repeatability.

Outputs: adopted workflow, measured value, learning return.

SUCCESS SCORECARD

Dimension	Measures to establish	Decision enabled
Adoption	Activation, weekly active use, repeat use, tool diversity, power-user cohort	Where coaching or access creates the most value
Workflow	Cycle time, completeness, rework, handoff quality, labor hours avoided	Which use cases earn scale
Trust	Human checkpoints, source use, policy exceptions, ownership and review	What requires stronger controls
Enablement	Demo-to-practice conversion, playbook reuse, champion coverage	Which enablement motion works
Learning	Time from feature release to validated workflow	How quickly VOLTO absorbs change

STAKEHOLDER SYSTEM

Outcome owners

Executive sponsor, functional leaders, finance, and delivery owners define the work and value.

Trust owners

Workspace admins, security, privacy, legal, data, and app owners define access and controls.

Adoption owners

Power users, champions, managers, and frontline users test, teach, reinforce, and improve.

EVIDENCE MAP

Role obligation	Verified evidence	How it transfers
Workflow optimization and automation	DudeWorth agentic workflow patterns; Vape-Jet AI-assisted cross-functional workflows	Hands-on conversion of work signals, context, judgment, escalation, and governance into repeatable mechanisms
Demonstration and enablement	Standard work, training, technical talks, IEEE programming, cross-functional operating routines	Translate techniques for different audiences and attach learning to real work
Usage analysis and adoption	Dashboards, performance measures, throughput visibility, readiness frameworks	Separate activity from outcome and instrument adoption
Prompt engineering and governance	Structured context, retrieval, HITL, decision records, evaluation and governance rails	Apply tested workflow, evaluation, adoption, and governance patterns directly to ChatGPT enablement
Cross-functional playbooks	Production, quality, engineering, support, customer success, ERP, CRM, logistics	Create function-specific playbooks while preserving one governance spine

DECISION ARCHITECTURE

Prioritize Which workflow has enough value, readiness, ownership, and adoption capacity to test now?	Bound What data, source, action, and human-authority rules must remain explicit?
Prove What quality, workflow, adoption, economics, and trust measures determine success?	Decide Standardize, scale, improve, hold, or retire - with an owner and review date.

QUESTIONS RUSSELL WOULD USE TO UNDERSTAND THE WORK

01 What would make this role unquestionably successful six months from now?	02 Is the primary customer VOLTO's workforce, a client workspace, or both?
03 Which functions already contain credible power users, and where is adoption ready to accelerate?	04 Who owns workspace administration, security, privacy, legal interpretation, and GPT or app approval?
05 Which recurring workflows offer the strongest combination of value, readiness, and reuse?	06 How does VOLTO distinguish a popular use case from a valuable one?
07 What usage, task, impact, and business-system data can this role access?	08 How should new ChatGPT capabilities enter the monthly learning and governance cycle?

HOW RUSSELL WOULD CONTRIBUTE

BUILD Role-specific workflow patterns, evaluation criteria, governance rails, and reusable playbooks.	ENABLE Demonstrations, practice, office hours, champion coaching, and reinforcement in real work.	MEASURE Adoption depth, workflow change, quality, economics, ownership, and learning speed.
